Coding seqences below are the result of integration and manual review of the following data: computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c=legans/html/CE_INDEX.html) and The C. similarity to other profect (http://worfdb.dfci.harvard.edu/), similarity to other profess from Blastx analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1112, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans researchers. tRNAs are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one ml3 subclone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The 5' cosmid is B0547, 1400 bp overlap; the 3' cosmid is C55C3, 200 bp overlap. Actual start of this cosmid is at base position 401 of T19E7; actual end is at 12238 of C55C3.

```

Submitted (29-MAY-2002) Department of Genetics, Washington University, Genome Sequencing Center, 4444 Forest Park Avenue, St. Louis, MO 63110, USA Louis, MO 63110, USA On Sep 7, 2001 this sequence version replaced gi:289775. Submitted by: email: rw@nematode.wustl.edu and jes@sanger.ac.uk Department of Genetics, Washington University St. Louis, MO 63110, USA, and Sanger Centre, Hinxton Hall Cambridge CB10 IR0, England Genome Sequencing Center

This sequence may not be the entire insert of this clone. may be shorter because we only sequence overlapping sections ce, or longer because we provide a small overlap between neighboring submissions.

CDS

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one ml3 subclone.

http://www.wormbase.org/db/seq/sequence?name=ZK688;class=Sequence For a graphical representation of this cosmid sequence and its analysis see:

NEIGHBORING COSMID INFORMATION

The 5' cosmid is C02C2, 1600 bp overlap; the 3' cosmid is C29E4, 1000 bp overlap. Actual start of this cosmid is at base position 1 of ZK688; actual end is at 36977 of ZK688.

Coding segences below are the result of integration and manual review of the following data: computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C. elegans Offecome cloning project (http://worfdb.dfci.harvard.edu/), (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research and personal communications with C. elegans GenBank submissions, are predicted using the program tRNAscan-SE (Lowe, T.NAs Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

```
This sequence has been validated by Multiple Complete Digest Mapping. Comparison of the experimentally derived map digest fragments with sequence-predicted fragments is given below. Small fragments below a variable cutoff (approximately 400-600bp) star not mapped and hence do not appear in the table. There are no significant remaining descrepancies between the experimental and predicted values. Uniquely ordered fragment groups are separated by dashed lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Base-by-base quality values are not generally visible from the Genbank flat file format but are available as part of this entry's ASN.1 file.

This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.
                                                                                                              , Wong, G.K.-S., Magness, C.L., Green, E.D.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2811.00
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16613.00
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3563.00
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5846.00

Human Chromosome Y Cosmid 7Al Genomic Sequence, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        For each base, there are (at least) three quality reads, with at least one read from each strand. A serious attempt at editing/finishing has been made to resolve all sequencing problems, such as guanine compressions.

Common 7al is part of a three cosmid contig, with cosmids 54E8 and 56B5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /cell_line="human/hamster J640-51"

                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated lung tumour-specific proteins and their corresponding CDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting useful for stimulating an immune response, and for reating cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.

The invention relates to isolated lung tumour-specific proteins and their corresponding CDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.

The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.
                                                                                                                                                                                                      Reed SG, Lodes MJ, Mohamath R, Secrist H, Benson DR, Indirias CY;

The invention relates to an isolated polynucleotide (ABN27253-ABN33262) with cytostatic activity. The polynucleotide is used to produce a polypeptide, to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and to inhibit tumour growth. The polynucleotide is used as a probe in mapping and tissue profiling. The encoded polypeptide and antibodies to the polypeptide can also be used for therapeutic and diagnostic purposes. The polynucleotide is useful for
                                                                                                                                                                                                                                                                                        printed
                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printer specification, but was obtained in electronic format directly from WIPO
                                                                                         New nucleic acid for producing a polypeptide, detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, and inhibiting tumor growth -

                                    AAQ79736 encodes AAR66604 a flower style-specific S-ribonuclease, isolated from a self-incompatable wild tomato species.
Flower style-specific S-ribonuclease and DNA coding sequence isolated from self-incompatible wild tomato species
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tomato S-ribonuclease gene and promoter sequence - useful for expressing genes in plant style cells, e.g. to confer self-incompatibility on the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes part of a tomato (Lycopersicon peruvianum) S-ribonuclease. The S-gene can confer self-
                                                                                                                                                                                                                                                                S-ribonuclease; plant style; promoter; tissue-specific; self-incompatibility; ds.

The present sequence is the tomato S12 gene from Lycopersicon peruvianum coding for an S-ribonuclease; the S12 promoter region has activity in plant style tissue. The S-gene can confer self-incompatibility on a plant. In addition, a desired DNA sequence can be expressed specifically in style cells of a plant using the

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucome and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epillepsy, neurofibromatcsis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal

```
The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation
                                                                                                                                                                                                                            Human; immune system disease; cytosine methylation; antiasthmatic; antiatreriosolerotic; antianeanic; cytostatic; nootropic; neuroprotective; anti-HY; anticonvulsant; ophthalmological; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antiinflammatory; cancer; eye disease; arteriosolearosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AlDS; epilepsy; neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID NO 2202; 32pp + Sequence Listing; German.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriaals and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

The invention relates to a nucleic acid (1) comprising a sequence at least 18 bases of a segment of the chemically pretreated DNA of genes associated with metabolism such as DUSP2 (NM_004418), EPHX2 (NM_00199), ODPR (NM_000320), SGSH (NM_000199), SHMT2 (NM_005412), SLC7A2 (NM_003046), SLC7A4 (NM_004173) and TYMS (NM_001071) (all undefined). (1) are useful for diagnosis and therapy of metabolic disease, solid tumours and cancers; as primer oligonucleotides for the amplification of DNA sequences, for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically treated DNA of genes associated with metabolism. An array of [1] is cuseful for ascertaining genetic and/or epigenetic parameters for the predisposition to specific diseases by analysing cytosine methylations. The method involves chemically treating genemic DNA sample by a solution of bisulphite, hydrogen sulphite or disulphite such that cytosine bases which are unmethylated at the 5th-position are converted to uracil or another base which is dissimilar to cytosine in terms of hybridisation behaviour and amplifying fragments of the chemically pretreated genomic DNA. The genomic DNA is from cells or cellular components which contain DNA, sources of DNA comprising, for e.g. cell lines, blopales, blobales, blobales, blobales, blobales, blobales, contined breast or liver histologic cobject slides and their combinations, genetic continetons as any mathem or margines and particular and margines and companies of nanetones are mathematically in any incompanies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAS63306-AAS63373 represent chemically pretreated metabolism associated genes, and related primers of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            parameters are mutations, in particular insertions, deletions, point mutations, inversions and polymorphisms of genes associated with metabolism and sequences further required for their regulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Epigenetic parameters are in particular cytosine methylations and further chemical modifications of DNA bases of genes associated with metabolism. Further epigenetic parameters include for e.g. the acetylation of histones which correlates with DNA methylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid, useful for diagnosis and therapy of metabolic disease, solid tumour and cancers, comprises segment of chemically modified genomic sequences of genes associated with metabolism -
  Chemically pretreated metabolism associated gene #50.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; Page 129-132; 143pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                        Drosophila melanogaster genomic polynucleotide SEQ ID NO 10711.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; SEQ ID NO 10711; 21pp + Sequence Listing; English.

The invention relates to a nucleic acid comprising a sequence of at least labbases of a segment of chemically pretreated DNA of genes associated with cell signalling. The activity of the modified sequences of the convention may be described as cytostatic. The object of the invention is to provide the chemically modified DNA of genes associated with cell signalling, as well as oligonucleotides and/or PNA-oligomers for particularly suitable for the diagnosis and/or therapy of genetic and ceptionic parameters of genes associated with cell signalling. The chemically modified DNA provided by the invention is useful for diagnosis and therapy of diseases such as solid tumours and cancer. The sequences given in records ABL70111-ABL70626 represent chemically pre-treated genes associated with cell signalling.

Once: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid, useful for diagnosis and therapy of diseases associated with cell signalling e.g. cancer, comprises chemically modified genomic sequences of genes associated with cell signalling

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as rethnopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epillapsy, neurofibromatosis, rheumatoid arthritis, psorlasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             leic acid comprising fragment of chemically modified gene, useful diagnosis and treatment of diseases associated with abnormal

The invention relates to 224 nucleic acid sequences comprising at least
18 bases of a chemically pretreated gene associated with gene regulation
20 selected from genes (or complementary sequences). The
21 chemical pretreatment converts cytosine bases unmethylated at the
22 chemical pretreatment converts cytosine bases unmethylated at the
23 chemical pretreatment converts cytosine bases unmethylated at the
24 sistillar to cytosine, to enable analysis of cytosine methylations.
25 The DNA sequences, oligomers (or sets/arrays) and method are
26 useful in the diagnosis of diseases (or predisposition to diseases)
27 checlated with gene regulation and in therapy of such genes,
28 sociated with gene regulation methylation patterns of such genes,
28 charter combined immunodeficiency disease, cardiac
29 cabling analysis of the cytosine methylation patterns of such genes,
20 cand therapy of e.g. severe combined immunodeficiency disease,
20 cathma, HDR syndrome, Saethre-Chotzen syndrome, renal disease,
20 cathma, HDR syndrome, Saethre-Chotzen syndrome, renal disease,
20 cascotated with the human gene regulation-associated genes.
30 contined in the sequence data for this specification and is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 16
KENERAL KANAN KANA
```

```
The present invention relates to chemically modified DNA sequences of signal transduction associated genes. The DNA sequences are chemically modified using a solution of bisulphite, hydrogen sulphite or disulphite. Also disclosed are oligonucleotides and/or PNA oligomers for detecting the cytosine methylation state (CpG islands) of these genes, and a method for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with signal transduction. The genomic DNA can be obtained from cells or cellular components which contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, cerebral-spinal fluid, tissue embedded in parafflin such as tissue from eyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, histologic object slides, and all their possible combinations. The sequences of the invention are useful for the diagnosis and therapy of diseases associated with signal transduction, or their complementary sequences.

Sequences of different genes associated with signal transduction, or their complementary sequence as specification, but was obtained in electronic format directly from the
                                                                                                                                                         Human; signal transduction associated gene; cytosine methylation state; CpG island; signal transduction associated disease; solid tumour; cancer; antitumour; cytostatic; mutant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide for diagnosis and therapy of diseases associated with signal transduction e.g. cancer, comprises chemically modified genomic sequences of genes associated with signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15881 BP; 4515 A; 204 C; 3588 G; 7574 T; 0 other;

The invention relates to a nucleic acid (I) comprising a sequence at least 18 bases in length of a segment of chemically pretreated DNA (II) of genes associated with development selected from 87 genes ilsted in the specification such as ACCPN, ADFN, or AFD1 and comprising one of 350 sequences (ABN79984-ABN80333) or their complements. The invention is sequences (ABN79984-ABN80333) or their complements. The invention is cuseful for the diagnosis or therapy of diseases associated with congenital heart disease related to homeobox containing genes (HOX), like diabetes, cancer, apoptosis related diseases. syndromes associated with congenital heart disease epilepsy, diseases related to histone deacetylation, Currarino syndrome, diseases related with the concernance syndrome, diseases related with the construction of the principle of the genes are useful for detecting the methylation state of all CpG dinucleotides within the 350 sequences or (II) and their complementary sequences, as primer oligonucleotides for the amplification of the 350 sequences, (II) and/or their complements and as o'cligomer probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  specification but is based on sequence information supplied to Derwent by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid useful for diagnosis and therapy of diseases associated with development genes such as diabetes, comprises a sequence of a segment of chemically pretreated DNA of genes associated
                                                                                                                                                                                                          Human; development; homeobox gene; HOX; diabetes; cancer; apoptosis; heart disease; epilepsy; histone deacetylation; muscular dystrophy; dwarfism; single nucleotide polymorphism; SNP; cytosine methylation; antidiabetic; cytostatic; anticonvulsant; ds.
                                                                                                                                                                  Human chemically modified disease associated gene SEQ ID NO 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 16633 BP; 4452 A; 142 C; 3667 G; 8372 T; 0 other;

PCR primers AAV42716-17 were used to amplify human beta galactosidase CDNA (see AAV42728). The amplified product is used as a genetic marker in the retreoviral vector of the invention. The specification describes a gene delivery vehicle which directs expression of a non-immunogenic previously inactive compound. Vectors expressing the markers and a heterologous sequence are useful in gene therapy. The vectors can be used to deliver a molecule into a target area where it may cause the activation of a previously inactive substance.
                                                                                                                                                                                         Retroviral vector; gene delivery vehicle; expression; PCR primer;

AAV42717
```

New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

Claim 1; SEQ ID 35000; 71pp + CD-ROM; English.

(GEST) GENSET.

```
The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST of the mRNAs because they are often obtained from oligo-dr primed cDNA sequences. Such ESTs are not well suited from oligo-dr primed cDNA derived from the 5' ends of mRNAs and even in those cases where longer S' ESTs are derived from mRNAs with Intent 5' UTR is rarely included. Used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             246

The present invention describes a composition (1) comprising: carriers and immunostimulants; and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polynucleotide (III) having a cDNA sequence (S1) from the 10912 nucleotide sequences as given in ABL77032 to ABL87934, (III) encoding (II) having a sequence (S2), a T cell comparison of (II), or antigon presenting cells that express (II).

(I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (II) has cytostatic activity. An oligonucleotide (IV) that hybridises to sample preferably serum or ovarian tassue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells with (III) or (III) is useful in design and preparation of the tumour potoeln comprising contacting to (IV) is nototelns in tumour cells; and to isolate a full length gene from a contacting to (IV) is and proteins in tumour contaction of the tumour polypeptides and proteins library e.g., a tumour cDNA library using well known
                                                                                                                                                                                                                                                                                                                                                               Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide -

The invention relates to isolated breast tumour proteins and nucleic acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the proteins and so included are expression vectors expressing the proteins or proteins, transformed cells and antibodies raised against the proteins or uncleic acids may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate breast tumour protein expression, i.e. breast tumours and breast cancer e.g by gene therapy. The nucleic assays to detect and quantitate the presence of similar nucleic acids in samples, and their complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The proteins, nucleic acids and antibodies may be used in assays to identify modulators (e.g. antagonists) of breast tumour protein expression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used as adiagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)) and in other immuno-purification diagnostic techniques. The present sequence is constitution against a normal breast conn library.

The invention relates to isolated polynucleotides ((I)-(IV) encoding breast cancer antigens SYN22A1, SYN23A2, B723P and B726P (4 of 172 cDNA comprising sequences with 90 % identity to(I)-(IV), an expression exector comprising the cDNAs, a host cell transformed with the expression vector comprising the cDNAs, a host cell transformed with the expression comprising the cDNAs, a host cell transformed with the expression probes, where I of the oligonucleotide primers or probes is specific for (I)-(IV) and isolated cDNAs comprising sequences with 90 % control itself the oligonucleotides in length. B728P paper of I)-(IV) and that is 10 nucleotides in length. B728P paper of I)-(IV) and that is 10 nucleotides in length. B728P paper of I)-(IV) and the sources (I)-(IV) and the syn22A1, SYN22A2, CCC and in the identification of therapeutic proteins, and serve as targets for the development of human therapeutic agents that may be transfected the treatment of breast cancer. In particular, they may be transfected breast cancer antigens and the may be cultured to express the concentral antigens and the production of antibodies against SYN22A12, SYN22A2, B723P and B726P, which in turn captument of breast cancer. Short 10 nucleotide sequences of (I) to (IV) creatment of breast cancer. Short 10 nucleotide sequences of (I) to (IV) creatment of breast cancer. Short 10 nucleotide sequences of (I) to (IV) creations for the detection of SYN22A12, SYN22A2, B723P and B726P in the specific cDNA of the invention
                                                                                                                        New nucleic acids encoding breast cancer antigens SYN22A12, SYN22A2,
B723P and B726P, useful for the prevention, diagnosis and treatment of
breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ovarian cancer; ovarian tumour; cytostatic; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human ovarian cancer related cDNA clone SEQ ID NO:10058.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         277

conjugating a polypeptide (II) of a ovariant canner. The present inventions a composition (I) conjugating canner. Collypeptide encoded by a polynucleotide (III) having a cDNA sequence (S1) from the 10912 nucleotide sequences as given in ABL/7023 to ABL87934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II).

(S1) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PSR). (I) comprising contecting the amount of polynucleotide hybridising contacting T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (III) is useful for stimulating and/or expanding T cells with (III) or (III). (IIII) as useful in design and preparation of the tumour polypeptides and proteins in tumour cells and to isolate a full length gene from a contact of the tumour colls and to isolate a full length gene from a contact of the tumour colls and to isolate a full length gene from a contact of the tumour colls and to isolate a full length gene from a contact of the tumour colls and to isolate a full length gene from a contact of the tumour colls.
                                                                                                                                                                                                                                                                                       the present invention describes a composition (I) comprising: carriers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human immune/haematopoietic antigen genomic sequence SEQ ID NO:32066
                                                                                                                                      Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      283

AAKE4951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
creatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
couplynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of haematopoietic darised clisases, especially
cancers and cancer metastases of haematopoietic antigen genomic
concers and cancer metastases of haematopoietic antigen genomic
sequences from the present invention. AAK854912 to AAK87950 and AAM82169
corporation.

The protein in the exemplification of the present invention.

```

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer
                                                                                                                                                                                                              in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated nucleic acid molecule associated with cancerous state of
Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -
                                                                                                                                                                                                                                                                                                         (I) is also useful as a pharmacodyanamic or pharmacogenomic marker.
                                                                                                                                                                                                                                                                                                                                                                                  312

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or lits complement. (I) is useful for:
(a) assessing whether a patient is affilicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer
                                                                                                                                                                                                              in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a
prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                 (1) is also useful as a pharmacodyanamic or pharmacogenomic marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder; ss

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving constituting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to a massess biodiversity and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and the nations and nations and nations and nations and nat

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gene; liver cancer; ds; hepatocellular carcinoma; hepatotropic; metastatic liver tumour; cytostatic; expression profile; disease state; disease progression; drug toxicity; drug efficacy; drug metabolism.
                                                                                           The polynuclectide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity issue growth activity, activin/inhibin activity chemotactic/chemotinentic activity, activin/inhibin activity activity, receptor/ligand activity, anti-inflammatory activity cadherin/tumour invasion suppressor activity, tumour inhibition activity, the polynuclectide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a
e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries.
                                                                                    The present sequence represents a human expressed sequence
The polynucleotide, which is a secreted RST, and the encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peres-Da-Silva S, Vockley JG;

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNR. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon.
tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, dury toxicity, drug efficacy and drug metabolism. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; cytosine methylation; 5'-CpG-3'; uracil; ĉytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the rappetutic drugs and of a wide range of diseases. e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or issue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in genomic sample of DNA. The sample is treated chemically to convert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridiated to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridiation to both classes is determined from the C label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders cof the central nervous, cardiovascular, gastrointestinal and respiratory cof the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. C MaD034121 represent genomic DNA sequences used to illustrate the corner and containing the degree of cytosine methylation described in etc.

The present invention describes primer sets for synthesising 5602

CC full-length cDNAs defined in the specification. Where a primer set

CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary

to the complementary strand of a polynucleotide which comprises one of

CC to the complements at least 15 nucleotides; or (b) a combination

CC of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

CC of an oligonucleotide comprising a sequence complementary to the

sequence and an oligonucleotide which comprises a 5'-end

CC oplynucleotide which comprises a 3'-end sequence, where the

CC oplynucleotide comprises at least 15 nucleotides and the complementary to a

cligonucleotide comprises at least 15 nucleotides and the compination of

the 5'-end sequence/3'-end sequence is selected from those defined in

cc plynucleotide comprises are useful for synthesising polynucleotides,

cc perticularly full-length cDNAs. The primers are also useful for the

cc detection and/or diagnosis of the abnormality of the proteins encoded by

CC detection and/or diagnosis of the abnormality of the proteins encoded by

CC AABBSB93 represent human cDNA sequences; AAB92446 to

CR AAB9SB93 represent human amino acid sequences; and AAH13629 to AAH13632

CC of AABBSB93 represent human amino acid sequences; and AAH13629 to AAH13632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated \ensuremath{\mathsf{DNA}} .
```

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The ampliton is hybridised to two classes, each with at least one member, of oligonocleotides and/or opeptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the two classes of oligomers, the degree of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide cypes and for investigating cell differentiation of cell or tissue cypes and for investigating cell differentiation. The method allows the method for determining the degree of cytosine methylation described in the disclosure of the invention.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic convert contains the target C is amplified to form a labeled amplicon. DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridisation to beptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (I) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardidovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (11) for differentiation of cell or tissue control investigating cell differentiation. The method allows the methylation status of many cresidues to be determined simulated the method of determining the degree of cytosine methylation described in the status of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.
      Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA .

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one can the degree of hybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the captured drags and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory collymorphisms (SNP's): and (ii) for differentiation of call or tissue control in the central nervous, cardiovascular, gastrointestinal and respiratory collymorphisms (SNP's): and (ii) for differentiation of call or tissue control in the central nervous of many cresidues to be determined simultaneously.

AAD05053-AAD05106 represent cDNAs corresponding to 15 human secreted protein genes, and AAE01164-AAE01217 represent the proteins they encode. protein genes, and AAE01226 represent human secreted protein fragments or variants. The secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing. The secreted protein and their genes are useful for preventing. The reating or ameliorating and their genes are useful for preventing. Createring or ameliorating medical conditions can be diagnosed by determining the emonit of the new genes. Specific uses are described for each of the creating products for the diagnosed by determining the presence of mutations in the new genes. Specific uses are described for each of the creation of the diagnoses or treatment of proliferative disorders for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, callergies, neurological disorders (e.g., rheumatoid arthritis), inflammation, altergies, neurological disorders, schizophrenia, asthma, callergies, neurological disorders, schizophrenia, asthma, creationsesies, cognitive disorders, schizophrenia, asthma, creationsesies, cognitive disorders, pregnancy-related disorders, endocrine disorders, pregnancy-related disorders, endocrine cardiovascular disorders, pregnency callergies, neurological proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used in alleviating symptoms associated with the disorders mentioned above, and alleviating symptoms associated with the disorders mentioned above, and in alleviating symptoms associated with the disorders or enzyme linked.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, and prevention of: (a) cancer, e.g. breast and ovarian cancer and prevention of: (a) cancer, e.g. breast and ovarian cancer and cother cancers of the adrenal gland, bone, bone marrow, breast, chematical aract, liver, lung, or urogenital; (b) immune discrete e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular discrete as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g. diagnosis -

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chair reaction (FGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The capture of the complex of the complex of (II) and for identifying expressed genes. (I) is useful in gene therapy techniques of the restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving or (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical magning of stees expressing (II). (I) and (II) are useful in medical insorting disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensits, gene mapping, identification of mutations or expensible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Complex of the parent of this patent did not appear in the printed the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the

The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from identified within the present sequence. The 5' ESTS were prepared from fortal human RNAs or polyA+ RNAS derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primad cDNA ilbraries. Such ESTS are not well suited for isolating cDNA sequences cDNA sequences have been obtained, the full 5' UTR is rarely included. She ESTS are derived from mRNAs and even in those cases where longer used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

Human; foetal liver; gene expression; single exon nucleic acid probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                              measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Probe #8345 for gene expression analysis in human heart cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, gene expression; heart; microarray; vascular system; probe;

The present invention relates to single exon nucleic acid probes for present sequence is one such probe. The probes may be used from human heart. The predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular congenital heart disease.

Someonital heart disease, hypertension, cardiac arrhythmias and Note: The sequence data for this patent did not form part of the printed at fip. Wibo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                   Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; brain expressed exon; gene expression analysis; probe;

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.
                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for
